This invention describes novel human and murine poly(ADP-ribose)
polymerase (PARP) homologues, which are characterised by an amino acid
sequence with a functional NAD^+-binding site and no zinc finger
sequence motif, of general formula Cx.2Cx_2Mx_2Cr.]. The nucleic acid
sequences, PARP homologues and antibodies are useful for analytic
detection of PARP homologues and for identifying PARP effectors or
binding partners as well as for determining their effectiveness.
C PARP-binding partners are useful for the diagnosis or therapy of a
disease condition, which is the result of a PARP protein, especially an
energy deficiency, which may comprise tissue damage from cell death
concrosis or apoptosis. The disease condition may be chosen
from a neurodegenerative illness, or sepsis or ischemic tissue damage,
in particular neurotoxic disturbances, etc. This sequence represents the
human PARP3 protein used in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             121 AKKDFEKKFREKTKNNWAERDHFVSHPGKYTLIEVQAEDEAQEAVVKVDRGPVRTVTKRV 180

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to antisense oligonucleotides targeted to human PARP nucleic acid and inhibiting expression of human PARP. PARP PARP ply (ADP-ribose) polymerase plays an important role in chromatin decondensation, DNA replication, DNA repair, gene expression, malignant transformation, cellular differentiation and apoptosis. The antisense oligonucleotide inhibitors are useful for inhibiting the expression of PARP in human cells or tissues. They are also useful for treating a human with a disease associated with PARP especially hyperproliferative disorders (e.g. cancer), cellular injury resulting from oxidative stress, neurological (e.g parkinsonism, meningitis-associated intracranial complications and ischaemia), inflammatory and autoimmune disorders (e.g arthritis) and diabetes. The present sequence is a PARP protein,

                                                                                                   polymerase (PARP) homologues, which are characterised by an amino acid sequence with a functional NAD^+-binding site and no zinc finger sequence mouti, of general formula Cx_2Cx_2MHX_2C (I). The nucleic acid sequences moutif, of general formula Cx_2Cx_2MHX_2C (I). The nucleic acid detection of PARP homologues and antibodies are useful for analytic detection of PARP homologues and for identifying PARP effectors or binding partners, as well as for determining their effectiveness. PARP-binding partners are useful for the diagnosis or therapy of a disease condition, which is the result of a PARP protein, especially an energy deficiency, which may comprise tissue damage from cell death following necrosis or apoptosis. The disease condition may be chosen from a neurodegenerative illness, or sepsis or ischemic tissue damage, in particular neurotoxic disturbances, etc. This sequence represents the murine PARPI protein used in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   181 QPCSLDPATQKLITNIFSKEMFKNTMALMDLDVKKMPLGKLSKQQIARGFEALEALEEAL 240

Murine PARP1 (long) homologue protein.

ţ,

(first entry)

31-MAR-2000

```
polymerase (PARP) homologues, which are characterised by an amino acid sequence with a functional NAD^+-binding site and no zinc finger sequence with a functional NAD^+-binding site and no zinc finger sequences. PARP homologues and antibodies are useful for analytic detection of PARP homologues and for identifying PARP effectors or binding partners as well as for determining their effectiveness. PARP-binding partners are useful for the diagnosis or therapy of a disease condition, which is the result of a PARP protein, especially an energy deficiency, which may comprise tissue damage from cell death following necrosis or apoptosis. The disease condition may be chosen from a neurodegenerative illness, or sepsis or ischemic tissue damage, in particular neurotoxic disturbances, etc. This sequence represents the murine PARPI protein used in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    QALQAV-SEQEKTVEEVPHPLDRDYQLLKCQLQLLDSGAPEYKVIQTYLEQTGSNHRCPT 354

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to antisense oligonucleotides targeted to human PARP nucleic acid and inhibiting expression of human PARP. PARP (POLY (ADP-ribose) polymerase plays an important role in chromatin decondensation, DNA replication, DNA repair, gene expression, malignant transformation, cellular differentiation and apoptosis. The antisense oligonucleotide inhibitors are useful for inhibiting the expression of PARP in human cells or tissues. They are also useful for treating a human with a disease associated with PARP especially hyperproliferative disorders (e.g. cancer), cellular injury resulting from oxidative stress, meurological (e.g parkinsonism, meningitis-associated intracranial complications and isohaemia), inflammatory and autoimmune disorders (e.g arthritis) and diabetes. The present sequence is a PARP protein,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence
```

```
This sequence represents human poly(ADP-ribose) polymerase (hPARP2).
This protein causes the covalent addition of polymers of ADP-ribose
to protein targets. hPARP2 activity is induced in many instances of
coxidative stress or during inflammation where there is direct damage
to the DNA. hPARP2 may be used to identify antagonists which
may be used to treat a human having a disorder mediated by PARP2
may be used to treat a human having a disorder mediated by PARP2
may be used to treat a human having a disorder mediated by PARP2

                                                                                                                                                                                                                    g
                                                                                                                                                                                                                                                                                                                                                         ò
                                                                                                                                                                                                                                                                                                                                         AAC7446 to AAC77606 encode the proteins given in AAB40237 to AAB43397, which represent the human ORFX open reading frames 1 to 3161. The ORFX sequences have activities such as: cytostatic; hepatotropic; vulnerary; sequences have activities such as: cytostatic; hepatotropic; vulnerary; osteopathic; antiparkinsonian; nootropic; neuroprotective; catalant; thrombolytic; cagulant; vasotropic; neuroprotective; catalant; thrombolytic; cagulant; vasotropic; antidiabetic; hypotensive; dermatological; immunosuppressive; antidiabetic; hypotensive; or predisposition to, or preventing or treating the presence of or predisposition to, or preventing or treating pathological conditions associated with an ORFX-associated disorder. The nucleic acids can be used to express ORFX proteins in gene therapy coliferative disorders, neurodegenerative disorders, osteoarthritis, graft vs host disease, cardiovascular disease, diabetes mellitus, cycliferative disorders, neurodegenerative disorders, asthma, bacterial or fungal infection, malaria, autoimmune disorders, asthma, allergies, aplastic anaemia, burns, wounds, bone and cartilage damage, nocturnal haemoglobinuria, antilifiammatory disease; to enhance coagulation; to inhibit thrombosis; and as a contraceptive.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       21;

The invention relates to antisense oligonucleotides targeted to human PARP nucleic acid and inhibiting expression of human PARP. PARP (POL) (ADP-ribose) polymerase plays an important role in chromatin decondensation, DNA replication, DNA repair, gene expression, malignant transformation, cellular differentiation and apoptosis. The antisense oligonucleotide inhibitors are useful for inhibiting the expression of PARP in human cells or tissues. They are also useful for treating a human with a disease associated with PARP especially hyperproliferative disorders (e.g. cancer), cellular injury resulting from oxidative stress, neurological (e.g parkinsonism, meningitis-associated intracranial complications and ischaemia), inflammatory and autoimmune disorders (e.g arthritis) and diabetes. The present sequence is a PARP protein, the cdNA encoding which was used to design the antisense
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human; PARP; Poly (ADP-ribose) polymerase; antisense oligonucleotide; cytostatic; nootropic; neuroprotective; antiinflammatory; antidiabetic; immunosuppressant; hyperproliferative disorder; cancer; cellular injury; oxidative stress; neurological disorder; parkinsonism; apoptosis; meningitis-associated intracranial complication; ischaemia; inflammatory disorder; autoimmune disorder; arthritis; diabetes.

The invention relates to antisense oligonucleotides targeted to human PARP nucleic acid and inhibiting expression of human PARP. PARP (PDI) (ADP-Tibose) polymerase plays an important role in chromatin decondensation, DNA replication, DNA repair, gene expression, malignant transformation, cellular differentiation and apoptosis. The antisense oligonucleotide inhibitors are useful for inhibiting the expression of PARP in human with a disease associated with PARP especially hyperproliferative disorders (e.g. cancer), cellular injury resulting from oxidative stress, neurological (e.g parkinsonism, meningitis-associated intracranial arthritis) and diabetes. The present sequence is a PARP protein, the cdNA encoding which was used to design the antisense
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           121
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    DAKKDFEKKFREKTKNNWAERDHFVSHPGKYTLIEV----QAEDEAQEAVVKVDRGPVRT 175

                                                                                                                                                                                                                                                                                                                        ద
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This invention describes novel human and murine poly(ADP-ribose)
polymerase (PARP) homologues, which are characterised by an amino acid
sequence with a functional NAD<sup>+</sup>-binding site and no zinc finger
sequence motif, of general formula CX_2CX_ZMHX_2C (I). The nucleic acid
sequences, PARP homologues and antibodies are useful for analytic
detection of PARP homologues and for identifying PARP effectors or
binding partners, as well as for determining their effectiveness.
PARP-binding partners are useful for the diagnosis or therapy of a
disease condition, which is the result of a PARP protein, especially an
energy deficiency, which may comprise tissue damage from cell death
following necrosis or apoptosis. The disease condition may be chosen
from a neurodegenerative illness, or sepsis or ischemic tissue damage,
in particular neurotoxic disturbances, etc. This sequence represents the
human PARP2 protein used in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               21;

antidiabetic. (I) are especially used for treating or preventing antidiabetic. (I) are especially used for treating or preventing to neurodegenerative disease or neuronal damage (specifically associated with ischemia, trauma or massive bleading, especially apoplexy or spinal-cranial trauma; or Alzheimer's disease, Huntington's disease or Parkinson's disease), treating or preventing ischemic damage (specifically renal damage after renal ischemia or during and after kidney transplantation or heart damage after cardiac ischemia), treating epilepsy, specifically generalized epileptic attacks (e.g. petit mal and tonic-clonic attacks) or partial epileptic attacks (e.g. temporal lope and complex partial attacks), treating microlifarction (e.g. during and after heart valve replacement, aneurym resectioning and heart transplantation), revascularization of critically constricted coronary arteries (e.g. after PCTA or by-pass operations) or peripheral arteries (e.g. leg arteries), treating acute mycoardial ischemia and damage during or after its mechanical or drug-induced lysis and treating tumors and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                21;
                                                                                                                                                                                                                                                                                                                                                                                                                                   their metastasis, sepsis and septic shock, inflammatory and rheumatic disease (e.g. rheumatoid arthritis), and diabetes mellitus. Although (I) inhibit PARP (i.e. the known form designated PARPI), they especially selectively and strongly inhibit PARP homologs, specifically the homolog PARP2. In particular (I) have very strong PARP2 inhibitory activity (e.g. with K.i values of 1-20 nM) and high selectivity for PARP2 relative to PARPI (generally by a factor of more than 5).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |||||||| :|||| | : : | : | |||||| : : || gkgiyfadmssksanycfasr--lkntgllllsevalgqcnelleanpkaegllggkhst 502

This sequence represents a mover numen porty car. This sequences with at least 95% identity to the shipARRS2 variants and sequences with at least 95% identity to the shipARRS2 variants and sequences with at least 95% identity to the shipARRS2 protein an shipARRS2 nucleic acid sequence; the recombinant expression of shipARRS2; and an antibody specific for shipARRS2 shipARRS2 proteins of nucleotides are useful as vaccines for inducing an immunological response in a mammal. The shipARRS2 protein is useful for identifying compounds which inhibit or stimulate its activity or expression level. Such agonists and antagonists of shipARRS2 are useful for treating human diseases including ischaemia and ischaemic tissue injury (e.g., cerebral and cardiac ischaemia, myocardial infarction, stroke), inflammation, and cardiac ischaemia, myocardial infarction, stroke), inflammation, neurodegenerative diseases (e.g., farkinson's disease and Alzheimer's disease). shipARS2 nucleic acids are useful as diagnostic reagents for detecting mutations in the associated gene; as hybridisation probes to isolate full-length shipARS2 colks and sbhPARS2 genomic clones; and for chromosome localisation studies. The sbhPARS2 genomic clones; and for chromosome localisation studies are also useful in screening methods for detecting the effect of added compounds on the production of mRNA and cheecting the effect of added compounds on the production of mRNA and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    20;

                                                                                                                                                                 poly(ADP-ribose) polymerase (PARP) protein (also known as poly(ADP-ribose) propresse). The PARP enzyme is involved in programmed cell death or apoptosis, and is a nuclear enzyme. The NAP polyvucleotide sequences can be used for modulation of programmed cell death in eukaryotic cells. The method is used, specifically in plants, to induce, or protect against, programmed cell death, depending on the extent to which PARP activity is reduced. Reducing expression of endogenous NAP class PARP only is also used to modulate programmed cell death, to increase growth rate and to produce plant cells that are more tolerant of stress (cold, chemical treatments, pathogens, pests, drought, heat, etc., or during transformation). Particular applications are generation of plants that are resistant to fungi or nematodes; are male or female sterile; or have better seed shatter properties. The methods are also used to improve growth of transformed plant cells (and derived calli or
                                     Modulating cell death, growth and stress resistance in eukaryotes, specifically plants, used, e.g. to impart fungus or nematode resistance

The present invention describes primer sets for synthesising 5602

[10] Inagth cDNAs defined in the specification. Where a primer set
comprises: (a) an oligo-dT primer and an oligounclectide complementary
to the complementary strand of a polynuclectide which comprises one of
the 5602 nucleotide comprises at least 15 nucleotides; or (b) a combination
oligonucleotide comprises at least 15 nucleotides; or (b) a combination
of an oligonucleotide comprising a sequence complementary to the
complementary strand of a polynucleotide which comprises a 5'-end
sequence and an oligonucleotide comprising a sequence complementary to a
polynucleotide which comprises at 3'-end sequence. Where the
oligonucleotide which comprises at 3'-end sequence, sequence of an oligonucleotide which comprises at least 15 nucleotides and the combination of
the 5'-end sequence 3'-end sequence; selected from those defined in
the specification. The primer sets can be used in antisense therapy and
in gene therapy. The primers are useful for synthesising polynucleotides,
particularly full-length cDNAs. The primers are also useful for the
connection and/or diagnosis of the abnormality of the full-length
cDNAs easily without any specialised methods. AAH13628 and
AAH13633 to AAH18742 represent human cDNA sequences; AAB92446 to
AAH13633 to AAH18742 represent human cDNA sequences; and AAH13632
represent cliquourledectides, all of which are used in the exemplification Primer sets for synthesizing polynucleotides, particularly the 5602 full-length cDNAs defined in the specification, and for the detection and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs. SwissProt_40:* Database :

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                             Similarity).

CATALYTIC ACTIVITY: NAD(+) + {ADP-D-ribosyl}(N)-acceptor-
nicotinamide + {ADP-D-ribosyl}(N+1)-acceptor.

SUBCELLULAR LOCATION: NUCLEAR (By similarity).

ALTERNATIVE PRODUCTS: 2 isoforms; 1 (shown here) and 2; may be
produced by alternative splicing.

TISSUE SPECIFICITY: WIDELY EXPRESSED. THE HIGHEST LEVELS ARE IN
THE BRAIN, HEART, PANCRESS, SKELETAL MUSCLE AND TESTIS; ALSO
DETECTED IN KIDNEY, LIVER, LUNG, PLACENTA, OVARY AND SPLEEN;
LEVELS ARE LOW IN LEUKOCYTES, COLON, SMALL INTESTINE, PROSTATE AND
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          GRAHVYCEGNDVYDVMLNQTNLQFNNNKYYLIQLLEDDAQRNFSVWMRWGRVGKMGQHSL 162

 AN ACCEPTOR CARBOXYL GROUP ON A HISTONE OR THE ENZYME ITSELF, AND FURTHER ADP-HEDGSTL GROUPS ARE TRANSFERRED TO THE 2'-POSITION OF THE TERMINEL ADENOSITE MOIETY, BUILDING UP A POLYMER WITH AN AVERAGE CHAIN LENGTH OF 20-30 UNITS.
SIMILARITY: BELONGS TO THE PARP FAMILY.
SIMILARITY: CONTAINS I BRCT DOMAIN.
 -!- SUBUNIT: HOMODIMER (Potential).
-!- SUBCELLULAR LOCATION: Nuclear.
-!- MISCELLANEOUS: THE ADP-D-RIBOSYL GROUP OF NAD(+) IS TRANSFERRED TO
 CATALYTIC ACTIVITY: NAD(+) + {ADP-D-ribosyl}(N)-acceptor = nicotinamide + {ADP-D-ribosyl}(N+1)-acceptor. COFACTOR: ZINC, CONTAINS TWO MOLES OF ZINC PER MOLE OF PROTEIN (BY
PROTEINS BY POLY (ADP-RIBOSYL) ATION. THE MODIFICATION IS DEPENDENT
 ON DNA AND IS INVOLVED IN THE REGULATION OF VARIOUS IMPORTANT CELLULAR PROCESSES SUCH AS DIFFERENTIATION, PROLIFERATION, AND TUMOR TRANSFORMATION AND ALSO IN THE REGULATION OF THE MOLECULAR

 EMBRYOS, PUPAE AND ADULTS. EXPRESSION IS HIGHEST IN EMBRYOS.

AN ACCEPTOR CARBOXYL GROUP ON A HISTONE OR THE ENZYME ITSELF, AND FURTHER ADP-RIBOSYL GROUP ON A HISTONE OR THE ENZYME ITSELF, AND FURTHER ADP-RIBOSYL GROUPS ARE TRANSFERRED TO THE 2'-POSITION OF THE TERMINAL ADENOSINE MOIETY, BUILDING UP A POLYMER WITH AN STRANGE CHAIN LENGTH OF 20-30 UNITS.

SIMILARITY: BELONGS TO THE PARP FAMILY.
SIMILARITY: CONTAINS I BRCT DOMAIN.
 SHORT FORM; ARE PRODUCED BY ALTERNATIVE SPLICING.
TISSUE SPECIFICITY: EXPRESSED IN ADULT FEMALE OCCYTES, ANAL PLATES
OF STAGE 12 EMBRYOS AND IN CELLS AROUND THE CENTRAL NERVOUS SYSTEM
IN LATER EMBRYOS.
DEVELOPMENTAL STAGE: EXPRESSED BOTH MATERNALLY AND ZYGOTICALLY IN
 EVENTS INVOLVED IN THE RECOVERY OF CELL FROM DNA DAWAGE.

CATALYTIC ACTIVITY: NAD(+) + {ADP-D-ribosyl}(N)-acceptor = nicotinamide + {ADP-D-ribosyl}(N+1)-acceptor.

COFACTOR: ZINC, CONTAINS TWO MOLES OF ZINC PER MOLE OF PROTEIN.
SUBCELLULAR LOCATION: Nuclear.

ALTERNATIVE PRODUCTS: 2 ISOFORMS; A LONG FORM (SHOWN HERE) AND A
 TUMOR TRANSFORMATION AND ALSO IN THE REGULATION OF THE MOLECULAR
Hanai S., Uchida M., Kobayashi S., Miwa M., Uchida K.; "Genomic organization of Drosophila poly(ADP-ribose) polymerase and distribution of its mRNA during development."; J. Biol. Chem. 273:11881-11886(1998).
